

CERTIFICATE OF VERIFICATION

I, Huy Sun YE of 648-23 Yeoksam-dong, Gangnam-gu, Seoul, Republic of Korea state that the attached document is a true and complete translation to the best of my knowledge of the Korean-English language and that the writings contained in the following pages are correct English translation of the specification and claims of the Korean Patent Application Nos. P 2002- 37146, P 2002- 37148 and P 2002- 37624.

Dated this 23th day of August, 2004

Signature of translator: H. S. YE

Huy Sun YE

KOREAN INTELLECTUAL PROPERTY OFFICE

5

This is to certify that the following application annexed hereto is a

10 true copy from the records of the Korean Industrial Property Office.

Application Number: Patent Application No. 10-2002-0037146

15 Date of Application: June 28, 2002

Applicant(s): LG Electronics Inc.

20 **COMMISIONER**

[ABSTRACT OF THE DISCLOSURE]

[ABSTRACT]

The present invention relates to a microwave oven provided with a cavity for heating food placed therein, an electrical device chamber that accommodates several 5 electrical equipment components for generating microwaves to the cavity and a toaster provided in the electrical device chamber at front end thereof to be exposed, the microwave oven including projections 74c containing extensions 74a and fastening hooks 74b, which is extruded outwardly from lower portion of both side ends of a tray 74 on which a sliced bread is positioned; a first and second fastening slits 70a and 70b 10 formed at a tray support 70 supporting the tray 74 at the top portion, for accommodating the fastening hooks and extensions; and a hole 70c provided on a lower portion of the first fastening slit 70a into which the extension is inserted, to be slip fit engaged with a corresponding projections 74c.

[TYPICAL DRAWING]

15 FIG. 3

[INDEX WORDS]

microwave oven, toaster, tray, crumb

[SPECIFICATION]

[TITLE OF THE INVENTION]

TRAY ASSEMBLY FOR MICROWAVE OVEN INCORPORATING TOASTER

[BRIEF DESCRIPTION OF THE DRAWINGS]

5 FIG. 1 illustrates an exploded perspective view of a related art microwave oven;

FIG. 2 illustrates an exploded perspective view of a microwave oven incorporating a toaster in accordance with the present invention;

FIG. 3 illustrates a perspective view of the tray assembly included within the toaster in accordance with the present invention; and,

10 FIG. 4 is a plan view illustrating a heating plate in accordance with a preferred embodiment of the present invention.

Reference numerals of the essential parts in the drawings

[DETAILED DESCRIPTION OF THE INVENTION]

[OBJECT OF THE INVENTION]

[FIELD OF THE INVENTION AND DISCUSSION OF THE RELATED ART]

10 The present invention relates to a microwave incorporating a toaster, and more particularly, to a tray assembly for a microwave oven which is designed in a compact structure so as to be assembled and/or disassembled in an easy manner and which supports a slice of bread inserted into the tray in a standing position.

15 Generally, microwave ovens are cooking appliances for heating an object by the application of microwaves. Construction of the microwave oven will now be described.

And the microwave oven includes generally a cavity 2 in which an object or food is heated by microwaves. The cavity is formed in an interior of a cavity assembly

1. The cavity 2 is closed and opened by the cavity door 4.

20 A component chamber 10 that accommodates several electrical equipment components for generating microwaves is positioned at one end of the cavity 2 (located at right part as seen in the figures) and is covered by an outer case 6. The electrical equipment includes a magnetron 12 for generating microwaves, a high-voltage transformer 14 for supplying a high voltage to the magnetron 12, and a fan 16 for producing airflow in the cavity 2 to cool the heated electrical equipment.

Since the microwave oven heats the cooking object by means of microwaves, it is improper to toast bread. Accordingly, microwave ovens capable of toasting bread, as well as cooking or heating the cooking object by means of microwaves have been developed.

5 To cope with the above request, there is designed a microwave oven having a toaster case positioned in front of an electric equipment component chamber 10. The toaster case is generally installed a heater assembly for correspondingly heat the both surfaces of the bread being vertically stood.

[TECHNICAL TASKS TO BE ACHIEVED BY THE INVENTION]

10 And, bread being sliced is inserted into an entrance of the microwave oven including the toaster, in a vertical position, to be heated, and thereafter being heated at a constant temperature.

15 In such microwave ovens including a toaster, crumbs of bread are generated as a slice of bread is heated within the toaster. During the heating of the bread, the crumbs may be adhered to a tray assembly on which the sliced bread is disposed. Therefore, the tray assembly must be designed to be easily assembled as well as cleaned.

20 For this reason, an object of the present invention is to provide a tray assembly including a tray on which a food item is placed and a tray support supporting such tray must be designed such that the tray and tray support can be easily assembled and/or disassembled for the purpose of cleaning and maintaining a toaster.

[PREFERRED EMBODIMENTS OF THE INVENTION]

25 To achieve these objects and other advantages and in accordance with the purpose of the invention, as embodied and broadly described herein, a microwave oven provided with a cavity for heating food placed therein, an electrical device chamber that accommodates several electrical equipment components for generating microwaves to

the cavity and a toaster provided in the electrical device chamber at front end thereof to be exposed, the microwave oven including an elevating bracket containing extensions and fastening hooks, which is extruded outwardly from lower portion of both side ends of a tray on which a sliced bread is positioned, a plurality of fastening slits for 5 accommodating the fastening hooks and extensions, a fastening hole provided on a lower portion of the fastening slits into which the extension is inserted, to be slip fit engaged with a corresponding detent.

Reference will now be made in detail to the preferred embodiments of the present invention, examples of which are illustrated in the accompanying drawings. 10 Wherever possible, the same reference numbers will be used throughout the drawings to refer to the same or like parts.

FIG. 2 illustrates an exploded perspective view of a microwave oven incorporating a toaster in accordance with the principals of the present invention. Referring to FIG. 2, a cavity 22 is arranged within a cavity assembly 20 and an electrical 15 device chamber 23 is arranged adjacent to the cavity 22. An object (e.g., food) arranged within the cavity 22 may be heated by microwaves generated by various electrical devices arranged within the electrical device chamber 23. The microwave oven shown in FIG. 2 includes a front plate 21.

The cavity 22 is opened and closed by a cavity door 24, selectively. If the 20 cavity door 24 is closed, the cavity door 24 is in contact with the front plate 21 to cover the cavity 22. Reference number 25 indicates a door handle which is used by a user to open or close the cavity door 24. The cavity assembly 20 and the electrical device chamber 23 are covered by an outer case 27 defining outer surfaces of upper and side portions of the microwave oven.

25 A toaster 30 is installed in the electrical device chamber 23 in such a way that it

penetrates the front plate 21. The toaster 30 according to the present invention will now be described in detail with reference to Fig. 3.

A toaster panel 32 is provided at a front side of the toaster 30. Material of the outer surface of the toaster panel 32 is similar to or the same as that of the cavity door 24, so that the toaster panel 32 provides the microwave with a smooth front surface together with the cavity door 24 and a toaster door, as shown in Fig. 2. A rear of the toaster panel 32 is provided with a plurality of fixing hooks 33, to be fixed on the front plate 21.

The toaster 30 further includes a toaster door 40 hinged to the toaster panel 32.

10 To this end, the toaster panel 32 has a hinge hole 34, while the toaster door 40 has a hinge pin 42. The material of the outer surface of the door panel 41 may be similar or identical to that of the toaster panel 32. At the lower portion of the door panel 41 is inserted a hinge hole 34 and the toaster door 40 may rotate around a hinge axis formed by the hinge pin 42 so as to be opened and closed. The toaster door 40 may be installed 15 in such a manner that thereof a center of the gravity thereof is near the door handle 43 rather than the hinge pin 42. And, at the lower portion of the door panel 41 on which the hinge pin 42 is formed is disposed an aperture 45.

The toaster 30 further includes a toaster case 50 installed at the rear side of the toaster panel 32. The toaster case 50 is coupled to the toaster panel 32 through a 20 portion of the front plate 21 corresponding to the front side of the electrical device chamber 23. The toaster case 50 is made of metal and provides a space for toasting the slice of bread.

There is a case front plate 51 at the front of the toaster case 50. The case front plate 51 includes a case mouth 52, through which a slice of bread may be placed into 25 or removed from the toaster case 50. Meanwhile, there is a case rear plate 53 at the

rear of the toaster case 50. And, spring hooks 53' which are extended towards rear direction are provided at a lower portion of the case rear plate 53. The case rear plate 53 has a heater slot 53s for receiving a rear mounting boss 83'.

The toaster case 50 has a pair of moving slots 54 on its lower side walls. The 5 pair of moving slots 54 formed within a concave portion 55 on the toaster case 50. The concave portion 55 is formed as intruded inwardly the toaster case 50 so as to definite the moving height of a crumb tray 90. A bushing 72 is movable along the moving slot 54.

A toaster front 60 being made of metal substance is provided at the front of the 10 case front plate 51 and is positioned in an interior of the toaster panel 32. The toaster front 60 has a plurality of toaster entrances 62 formed in a rectangular at upper and lower directions, which are exposed when the toaster door 40 is opened. Each of the toaster entrances 62 is coupled to a respective case mouth 52 of the case front plate 51. Reference number 64 indicate lever slot.

15 A protector 65 is interposed between the toaster front 60 and the toaster panel 32. The protector 65 is made of insulating material to protect heat from being transferred to the toaster panel 32 from the toaster front 60.

A tray support 70 is installed inside the toaster case 50. There are disposed 20 bushings 72 at right and left sides of the tray support 70. The bushing 72 supports the tray support 70 and is moved along the moving slot 54 provided on each side of the toaster case 50. The tray support 70 supports at least one tray 74 in which each slice of bread is vertically positioned. The trays 74 are formed in the same number as the toaster entrances 62, and are protruded in a predetermined length towards the entrance 62 when the toaster door 40 is opened.

One end of the connecting lever 76 is coupled to the lower portion of the toaster door 40. The other end of the connecting lever 76 is hinged to the bushing 72. The connecting lever 76 is penetrated through the lever slot 64 and protruded to the front side of the toaster front 60.

5 The one end of the connecting lever, which is hinged to the bushing 72 is connected to one end of the spring 79. The other end of the spring 79 is hanged on spring hook 53' of the toaster case 50. The spring 79 pulls the end of the connecting lever 76 toward the spring hook 53'.

10 There is a heater assembly 80 mounted in the toaster case 50. The heater assembly is configured of a heating plate 82 and a supporter 85.

A tray assembly, T, arranged within the interior of the toaster case 50 will now be described detail with reference to FIG. 3. As shown in FIG. 3, the tray assembly T includes a tray support 70 and trays 74 securely arranged on top of the tray support 70. In one aspect of the present invention, the tray 74 may include a plurality of extensions 15 74a and hooks 74b, both being extended towards the lower portion, for supporting a food item arranged vertically thereon. The hooks 74b are extended towards the lower and rear portion of the tray. And, the extensions 74b include projections 74c protruded outwardly therefrom.

At the top portion of the tray support 70, on which the tray 74 is securely 20 arranged, are formed a first and second fastening slits 70a and 70b into which the extensions 74a and the hooks 74b are inserted. At the side wall of the tray support 70, which corresponds to the lower portion of the first fastening slit 70a is formed a hole 70c.

The hooks 74b of the tray 74 are inserted into the second fastening slit 70b at the 25 rear direction, the hooks 74b being engaged with the rear portion of the tray by pushing

the tray 74 towards rear direction. At this position, if the extensions 74a are inserted into the first fastening slit 70a, the projections 74c are elastically slip fit engaged with the hole 70c, thereby the front portion of the tray 74 are automatically engaged with the tray support 70.

5 On the other hand, the tray 74 may be easily disassembled (detached) from the tray support 70 upon initially detaching the plurality of extensions 74a from the first fastening slit 70a by detaching the plurality of fastening hooks 74b from the corresponding first plurality of the second fastening slit 70b.

Accordingly, the tray 74 is easily detached from the tray support 70.

10 One end of the connecting lever 76 is coupled to the lower portion of the toaster door 40, while the other end of the connecting lever 76 is hinged to the bushing 72. The connecting lever 76 is penetrated through the lever slot 64 and protruded to the front side of the toaster front 60. The one end of the connecting lever, which is hinged to the bushing 72 is connected to one end of the spring 79. The other end of the spring 15 79 is hanged on spring hook 53' of the toaster case 50. The spring 79 performs elastic force to pull the end of the connecting lever 76 toward the rear portion of the moving slots 54.

20 There is a heater assembly 80 mounted in the toaster case 50. The heater assembly 80 is formed on side walls corresponding to each other, so as to heat both sides of the bread.

There is the crumb tray 90 slidingly received and installed in the toaster case 50 through the lower portion of the toaster panel 32. On the crumb tray 90 is mounted a tray body 91 made of metal substances. The tray body 91 is in a rectangular shape being extended to front and rear directions, and side walls 91f are formed at four edges 25 of the tray body 91 in a predetermined height. In the meantime, the tray body 91

includes a crumb storage 91' therein, the top of which is opened. The crumb storage 91' serves to receive the crumbs generated from the bread during the heating of the bread at the upper portion of the tray 74.

The side walls 91f are formed at the rest of the tray except for the front end of 5 the tray body 91, which has a rear curved flange 91b at the top portion thereof. The rear flange 91b serves as reinforcing the top portion of the side walls 91f and preventing the metal parts from being exposed to the outside. At the front end of the tray body 91 is formed a plurality of fastening holes 91h.

To this end, a crumb tray handle 92 is provided at a front portion of the crumb 10 tray 90. The crumb tray handle 92 is made of the same material as the door panel 41, which is extended towards the bottom portion lower than the tray body 91, so as to enable users to grip the same.

There is a coupling arm formed at the tray handle 92 to make the front end of the tray body 91 inserted thereinto. The coupling arm 94 is extended in the rear portion 15 of the crumb tray handle 92, so as to surround the lower portion of the tray body 91 and an exterior and top portions of the side walls 91f. The coupling arms 97 as described above are formed at both ends of the crumb tray handle 92. One of the coupling arms 94 being corresponded to the tray body 91 is formed an extrusion 95 which is inserted into the fastening hole 91h from the lower portion of the tray body 91.

20 The crumb tray handle 92 is arranged on the aperture 45 between the hinge pin 42 of the toaster door 40, which the tray body 91 is penetrated through the tray entrance 37 of the toaster panel 32. The crumb tray handle 92 is also made of the same material as the door panel 41.

25 The operation of the microwave oven incorporating a toaster according to the present invention will now be described in detail.

If a user opens the toaster door 40, a predetermined portion of the tray 74 projects from the toaster entrance 62. In one aspect of the present invention, the predetermined portion of the tray 74 projects from the toaster entrance 62 when the toaster door is completely opened. Next, bread 'B' may be placed in a vertical position 5 on the tray 74 by a user. If the toaster door 40 is closed, the bread will be moved inside the toaster case 50 as the tray 74 moves inwardly. Next, if power is supplied to a heater 80, the toaster starts to toast the bread 'B' by generating heat from the heating element wires of the heating plate.

The crumb generated from the bread during the heating procedure may be 10 dropped down on the crumb tray 90, while some parts will be remained on the tray assembly T which is configured of the tray 74 and tray support 70. In accordance with the present invention, the tray 74 and the tray support 70 may be easily detached from each other, thereby making it easier to clean the tray assembly.

As seen from above the tray 74 and the tray support 70 are easily assembled 15 and/or disassembled from each other.

It will be apparent to those skilled in the art that various modifications and variations can be made in the present invention without departing from the spirit or scope of the invention. Thus, it is intended that the present invention cover the modifications and variations of this invention provided they come within the scope of 20 the appended claims and their equivalents.

[EFFECT OF THE INVENTION]

As seen from above the tray 74 and the tray support 70 are easily assembled and/or disassembled from each other. Accordingly, users can easily clean the tray assembly T and fix or maintain the assembly in an effective manner.

What Is Claimed Is:

1. A microwave oven provided with a cavity for heating food placed therein, an electrical device chamber that accommodates several electrical equipment components
5 for generating microwaves to the cavity and a toaster provided in the electrical device chamber at front end thereof to be exposed, the microwave oven comprising:
projections 74c containing extensions 74a and fastening hooks 74b, which is extruded outwardly from lower portion of both side ends of a tray 74 on which a sliced bread is positioned;
- 10 a first and second fastening slits 70a and 70b formed at a tray support 70 supporting the tray 74 at the top portion, for accommodating the fastening hooks and extensions; and
a hole 70c provided on a lower portion of the first fastening slit 70a into which the extension is inserted, to be slip fit engaged with a corresponding projections 74c.
